enriched in respirable-sized parti	orted pulmonary response upon chronic inhalation exposure in rats to a toner cles compared to commercial toner.			

No pulmonary change was found at 1mg/m<sup>3</sup> which is most relevant to potential human exposure.

A minimal to mild degree of fibrosis was noted in 22% of the animals at  $4 \text{ mg/m}^3$ , and a mild to moderate degree of fibrosis was observed in 92% of the animals at  $16 \text{ mg/m}^3$ .

These findings are attributed to "lung overloading", a generic response to excessive amounts of any dust retained in the lung for a prolonged interval.
